- Additional work from ERGO that was created previous to Feb 2015, but completed since June 2015:
  - ERGO-36 - After refactoring the packages for Ergo, the analysis graph "what's next" option was broken. I fixed that.

<https://opensource.ncsa.illinois.edu/jira/browse/ERGO-36>

ERGO-41 - The Mac version was creating the settings and log files in a different location than Windows/Linux so it appeared those files were not being created. It was closed as not fixed after Omar did some digging and determined they were just in different locations than Windows/Mac and doing a "search" on the machine did not find them. He created a FAQ entry so users that run into issues on the Mac can know where to find the error log.

ERGO-44 - Add public repository by default. This is fixed.

<https://opensource.ncsa.illinois.edu/jira/browse/ERGO-44>

ERGO-54 - Replace CRLF line endings with unix endings. Some files that were refactored had windows line endings in them, which can cause problems for versioning systems. I fixed this.

ERGO-55 - Update US region plugin to contain all states and counties - Jong did this to remove our dependence on a web based postgis server for creating new scenarios. The shapefiles are now included in the software.
