FP-Akka QC Workflow

These pages describe the quality control (QC) and data cleaning workflow developed as part of the FilteredPush project (and used therein embedded in the FP infrastructure).

We have released a version of this workflow that can be run as a desktop application (demonstrated at SPNHC 2015, and in an iDigBio webinar).

Enduser documentation is at: http://wiki.datakurator.net/web/User_Documentation

Development

Code is in the FilteredPush repository on Sourceforge. Relevant components are FP-Akka (workflow/actor definitions in the Akka framework), FP-CurationServices (actor internals and web service wrappers), FP-Core (supporing FP code).
