

Installing pkg-config from source for OSX

Unfortunately, pkg-config does not come with OS X by default. Here are some notes on how to compile from source. It assumes that you have Xcode installed.

1) Download and extract

```
cd some-place-with-source-files
curl -O http://pkgconfig.freedesktop.org/releases/pkg-config-0.28.tar.gz
tar xzf pkg-config-0.28.tar.gz
```

2) Configure and Install

```
cd pkg-config-0.28
setenv CC /usr/bin/cc (for tcsh)
export CC=/usr/bin/cc (for bash)
```

2a) If you have super-user powers

```
./configure --prefix=/usr/local CC=$CC --with-internal-glib
make
sudo make install
```

2b) if not

```
./configure --prefix=$HOME/someplace/in/my/path CC=$CC --with-internal-glib
make
make install
```
