

Nested Collections

Current Specifications:

1. If you create a collection in a space or the collection page, you are creating a ROOT collection, and it shows up in the Collection Page.
2. If you create a collection within a collection is a NESTED collection. It does not show up in the collection page.
3. If you add a ROOT collection2 as a NESTED collection1, collection 2 will be inside collection1 as a nested collection, but it will still exist as a ROOT collection and show up in the collections page.
4. A collection can have multiple parents.
5. A ROOT collection doesn't have any parents and are the ones that show in the Collection Page.
6. Add Collection button inside a collection page, that gives the option to create a new collection or add a collection from a list.
7. A collection will have a parent list. And a root flag (Whether it is ROOT or not).

Questions/Pending:

1. Specify how permissions will work in the nested collection?
 - a. Who can create a nested collection? (Author or EditPermission)
 - b. Who can move a nested collection? (Author or EditPermission)
2. Can a collection be a NESTED collection of 2 ROOT collections? Is it a copy or a reference/link?
3. How do we differentiate a ROOT vs a NESTED collection? - A flag to indicate it is a root collection or not.

Future Improvements

1. Add Metadata or Tags to the collection
