

# Deployment Notes

- RabbitMQ username, virtual host and exchange:.  
Bi-hourly tests revealed the different exchanges Clowder used. It's in `~clowder/clowder/custom/custom.conf`.
  - dts-dev: user "clowder", vhost "clowder-dev", exchange "dts".
  - dts: user "dts-prod", vhost "clowder", exchange "dts".
  - Users don't matter, as long as they can access the vhost.
  - Exchanges matter when deploying a brand new tool, since new bindings from the exchange to the queue need to be created.
