THE NATIONAL DATA SERVICE

The National Data Service (NDS) is an emerging vision for how scientists and researchers across all disciplines can find, reuse, and publish data. It builds on the data archiving and sharing efforts already underway within specific communities and links them together with a common set of tools designed around the following capabilities:

Q Search The NDS will allow users to search across the data across the entire NDS. It will also allow users to search across the data across the entire NDS. It will also allow users to search across the data across the entire NDS.	P Publish The NDS will allow users to publish their data. It will also allow users to publish their data. It will also allow users to publish their data.	L Link The NDS will create robust connections between data and published articles. It will also allow users to link their data to their published articles.	R Reuse The NDS will not only provide access to data for research, it will provide tools for reusing data to answer questions or other projects to be related to the data.

The National DATA SERVICE

WHAT DOES IT MEAN TO BE A PARTICIPANT OF NDS?

- Commitment to addressing Big Data challenges of the scientific community and the public
- Making your science more effective through the interoperability of NDS components
- Creating broader impact through the interoperability of NDS components
- Finding and filling gaps between current NDS components
- Working within a broad governance model
 - Leveraging current Federal, State, and Institutional investments

GET INVOLVED WITH NDS

Help make open sharing of data and increased collaboration within and across disciplines a reality!

Go to www.nationaldataservice.org/join_involved to learn how to keep up with, contribute to, or join NDS.
